Red list of vascular plants of the Lublin Region

SUMMARY

The aim of this study is to present the updated list of rare and threatened vascular plant species in the Lublin province. The threatened species categories are presented according to the IUCN criteria. The regional list contains 408 species (that makes up 25% of the Lublin Region flora); 56 of which are considered critically endangered, 81 represent endangered species, 51 belong to the category of vulnerable species, and 49 are near threatened species, respectively. The presence of 37 species has not been confirmed and therefore they are listed as regionally extinct (RE). Of the total number of species, 134 are rare, but because the data about those species is insufficient, they have been classified as DD category (data deficient). The species of the genera: *Alchemilla*, *Callitriche*, *Hieracium*, *Oenothera*, *Rosa*, *Rubus* and *Taraxacum* have not been evaluated (NE category). Other species – those whose occurrence is doubtful and all neophytes were defined as not applicable (NA). The endangered taxa occur mostly in dry grasslands, deciduous forests, wetlands, and calcareous weed communities of cereal crops.

Keywords: vascular plants, red list, Lublin province

STRESZCZENIE

Celem pracy jest przedstawienie aktualnej listy rzadkich i zagrożonych gatunków roślin naczyniowych na terenie województwa lubelskiego. Kategorie zagrożenia przypisywano zgodnie z kryteriami IUNC. Na regionalnej czerwonej liście zagrożonych roślin naczyniowych znalazło się 408 gatunków (co stanowi 25% flory Lubelszczyzny), w tym 56 uznano za krytycznie zagrożone, 81 za zagrożone, 51 za narażone, 49 za bliskie zagrożeniu. Nie potwierdzono występowania w regionie

37 gatunków i przypisano im kategorię RE – regionalnie wymarłe. Natomiast 134 gatunków uznano za rzadkie, lecz brak jest wystarczających danych, by jednoznacznie przypisać im kategorię zagrożenia (DD). Ocenie nie poddano (kategoria NE) gatunków z rodzajów: *Alchemilla*, *Callitriche*, *Hieracium*, *Oenothera*, *Rosa*, *Rubus* i *Taraxacum*, natomiast gatunki, których występowanie w tym regionie jest wątpliwe oraz wszystkie kenofity, nie zostały zakwalifikowane do oceny (kategoria NA). Najbardziej zagrożone w regionie są gatunki związane z murawami kserotermicznymi, lasami liściastymi, torfowiskami oraz zbiorowiskami chwastów upraw zbożowych na podłożu wapiennym.

Słowa kluczowe: czerwona lista, rośliny naczyniowe, województwo lubelskie

INTRODUCTION

An increased rate of species extinction was observed in the second half of the 20th century (45). In order to spotlight this process, the first so-called “red lists” were prepared, which contained the record of endangered species. Between the 1970s and the 1980s, preliminary lists of endangered species were compiled in Poland (14) and in 1986 the first red list of endangered plants of Poland was published (48). One of the first red list of plants in certain regions located within the Lublin province (Lublin Upland, Western Volhynia, Roztocze, Western Polesie and the area of the former Chełm province) was prepared in the 1990s by Kucharczyk & Wójciak (26, 27). Other lists of rare species of the Western Polesie (25) and of the South Podlachian Lowland (9) have appeared later. Dynamics of the natural processes and an increasing scientific knowledge cause the red lists to be outdated in a short period of time and therefore new, updated lists need to be prepared periodically. This is why a new red list of plants of Poland (32) and a red list of plants of the Lublin province (23) were published subsequently. The aim of this study is to present an updated list of rare and threatened vascular plant species of the Lublin province.

MATERIALS AND METHODS

The list covered the area located within the borders of the administrative division of the Lublin province. This area is very diverse in respect of geological structure, geomorphological features, types of soil and in consequence of its flora and vegetation. It includes parts of three physico-geographical megaregions (19) and two (40) to three (28) geobotanical divisions (Fig. 1).

All native vascular plant species of Poland and the archaeophytes were included in the analysis. Some taxa, important in the sense of nature conservation, were listed in the rank of subspecies. The information either on the occurrence or on population dynamics of certain species were obtained from literature (8, 21, 22, 47, 10, 2, 33, 6, 43, 44, 20, 5, 30, 35, 36, 39, 41, 42, 15, 16, 17, 46, 3, 18) and from long lasting field observations and excursions conducted by scientists and amateurs alike. Because of insufficient data, species from genera: *Alchemilla*, *Callitriche*, *Hieracium*, *Oenothera*, *Rosa*, *Rubus* and *Taraxacum* (with few exceptions) were not evaluated and they received NE category. The previously reported species of questionable occurrence, together with all neophytes were defined as not applicable (NA) and were not included into the list. The list of questionable taxa was given separately.

The threat categories were given according to the IUCN criteria (11, 12, 13). Information about protection status in Poland (38) and the cause of species protection were provided for every species. Species names were given according to the vascular plant list of Poland (31) and in case of *Bolboschoenus* – according to Hroudová et al. (10). The syntaxonomical affiliation was given according to Matuszkiewicz (29). The species list follows the alphabetical order.

Fig. 1. The situation of the Lublin province.

A – Physico-geographical regionalization of Poland (19): 1 – non-Alpine Central Europe, 2 – East European Plain, 3 – Carpathian Region, 4 – borders of province, 5 – borders of macroregions; B – gobotanical division: 1 – Baltic Divide (40), 2 – Forest-Steppe Divide (40), 3 – Masovian-Polesie Divide (28), 4 – South Poland Uplands Divide (28), 5 – Volhynian Divide (28)

RESULTS

There are approx. 2,500 vascular plant species in Poland (1, 32), from which about 1,600 have been reported from the Lublin Region (8). Of this number, 408 species are listed in this paper. One third of them (134) are species of the DD (data deficient) category. Among these species are the ones which either were reported from single locations in the past and have not been found later (but there is still a chance for them to be rediscovered) or the ones that are indistinguishable or challenging to be identified in the field so that their population size and the number of localities are impossible to be estimated precisely. The following numbers of species represent one of the categories: critically endangered (CR) – 56 species, endangered (EN) – 81 species, vulnerable (VU) – 51 species, and near threatened (NT) – 49 species. The occurrence of 37 species has not been confirmed and therefore they are listed as regionally extinct (RE). The species list is presented in Tab. 1.

Explanations: Threat categories: CR – critically endangered, EN – endangered, VU – vulnerable, NT – near threatened, DD – data deficient, legal protection: s – strictly protected, c – partially protected, * – archaeophytes, 1 – uncertain status of the locality (47), 2 – exists in site where it was introduced in Dobrze (7) and Kolonia Żuków (Wojciechowski, oral communication in 2016), 3 – only a few individuals grow in site where it was introduced in Łańcuchów (24), 4 – explanations see Appendix 1.

The species given the NA (non-applicable) category, except for neophytes, are as follows: *Sparganium neglectum* BEEBY, *Senecio carniolicus* WILLD., *Alopecurus arundinaceus* POIR. in LAM., *Arenaria graminifolia* SCHRAD., *Arnica montana* L., *Apium repens* (JACQ.) LAG., *Bupleurum falcatum* L., *Bupleurum longifolium* L., *Carduus personata* (L.) JACQ., *Carex disperma* DEWEY, *Carex divulsa* STOKES, *Carex punctata* GAUDIN, *Cirsium acaule* SCOP., *Cirsium erisithales* (JACQ.) SCOP., *Conioselinum tataricum* HOFFM., *Cotoneaster integerrimus* MEDIK., *Cotoneaster niger* (THUNB.) FR., *Dentaria enneaphyllos* L., *Festuca heterophylla* LAM., *Galium sylvaticum* L., *Gentiana asclepiadea* L., *Hydrilla verticillata* (L. F.) ROYLE, *Juncus acutiflorus* EHRH. ex HOFFM., *Juncus gerardi* LOISEL, *Knautia dipsacifolia* KREUTZER, *Lathyrus montanus* BERNH., *Lathyrus pannonicus* (JACQ.) GARCKE, *Lathyrus pisiformis* L., *Listera cordata* (L.) R. BR., *Luronium natans* (L.) RA, *Najas flexilis* (WILLD.) ROSTK. & W. L. E. SCHMIDT, *Potamogeton filiformis* PERS., *Potentilla crantzii* (CRANTZ) BECK ex FRITSCH, *Reseda phyteuma* L., *Solanum alatum* MOENCH, *Symphytum cordatum* WALDST. & KIT. ex WILLD., *Tetragonolobus*

maritimus (L.) ROTH, *Trifolium ochroleucon* HUDS., *Trifolium spadiceum* L. One species, namely *Pinguicula vulgaris* L. subsp. *vulgaris* was not confirmed because in all of the populations of the Lublin province its subspecies: *bicolor* only grows. The species occurring in the Lublin Region, but not included in the list (and the species not given the NA/NE category) were taken under consideration and recognized as not threatened, therefore classified as LC (least concern).

CONCLUSION

The highest number of rare and endangered plant species occurs in calcareous dry grasslands of *Festuco-Brometea*, especially the ones that have developed on loess slopes of the *Festuco-Stipion* alliance (Tab. 2). Other large groups of species included in the list are these occurring in deciduous forests – especially of the *Potentillo albae-Quercion petraeae* and wetlands (*Scheuchzerio-Caricetea nigrae*, *Oxyccoco-Sphagnetetea*), meadows (*Molinio caeruleae*) and calcareous weed communities of cereal crops (*Caucalidion lappulae*).

Tab. 2. The share of endangered species in separate synecological groups.

Synecological group	RE	CR	EN	VU	NT	DD	Σ

Others	-	2	7	-	2	15	26
Together	37	56	81	51	49	134	408

A large number of DD-group species indicates that the flora of the Lublin province has insufficiently been explored and studied. Moreover, not all the re-

gions and habitats are equally well recognized. The regions that were sufficiently explored are: Lublin Upland, Volhynian Upland, Volhynian Polesie, Sandomierz Basin in contrast to the South Podlachian Lowland and northern parts of the Western Polesie. The well known habitats are: calcareous fens, dry grasslands. There is still a gap of knowledge about riparian and aquatic plant communities (with the exception of the Bug river valley and the Łęczna-Włodawa Plain, which are parts of the Western Polesie), forests (except these of the Roztocze region), marsh communities, and communities of ruderal and segetal plants species. This might be a source of disproportion in numbers of endangered species in respective synecological groups. Many new species have been found since 2006, and among them, some previously considered lost or extinct. These new species in the region are: *Carex atherodes* (Krawczyk, Michalczuk unpublished data), *Carex strigosa* (Wójciak unpublished data), *Isolepis supina* (30), *Schoenoplectus mucronatus* (Michalczuk unpublished data), *Orobanche pallidiflora* (34), *Orobanche arenaria* (35), *Elatine triandra* (Michalczuk, Krawczyk unpublished data), *Bolboschoenus maritimus* s.s. (Krawczyk, Michalczuk unpublished data), *Bolboschoenus planiculmis* (Krawczyk, Michalczuk unpublished data), *Potamogeton bertholdii* (Lorens unpublished data), *Viola uliginosa* (20). Rediscovered species are: *Adonis flammea* (Michalczuk unpublished data), *Botrychium matricarifolium* (Radliński unpublished data), *Botrychium multifidum* (Radliński unpublished data), *Elatine hydropiper* (Michalczuk, Krawczyk unpublished data), *Elatine alsinastrum* (37), *Alisma gramineum* (Michalczuk, Krawczyk unpublished data), *Caldesia parnassifolia* (3), *Epipogium aphyllum* (5), *Thesium alpinum* (5), *Oxycoccus microcarpus* (Michalczuk unpublished data), *Carex bohemica* (Michalczuk unpublished data), *Valeriana tripteris* (Radliński unpublished data).

ACKNOWLEDGMENT

We would like to express our gratitude to the ones who have contributed in any way to this list: Alicja Buczek, Michał Chernetsky, Piotr Chmielewski, Agnieszka Dąbrowska, Zbigniew Jaszcz, Paweł Kalinowski, Bogdan Lorens, Krzysztof Oklejewicz, Bogdan Radliński, Adam Rapa, Jacek Rosły, Andrzej Różycki, Anna Rysiak, Ryszard Sawicki, Piotr Sugier, Grażyna Szymczak, Danuta Urban, Marek Wierzba, Hanna Wójciak, Janusz Wójciak, Małgorzata Wrzesień, Grzegorz Wtykło, Stanisław Zygmunt. Our special thanks go to prof. Adam Zajac for providing us access to the ATPOL database.

Appendix 1. Criteria of threats category according to IUCN (2010)

Use any of the criteria A–E	Critically Endangered	Endangered	Vulnerable
A. Population reduction	Declines measured over the longer of 10 years or 3 generations		
A1	≥ 90%	≥ 70%	≥ 50%
A2, A3 & A4	≥ 80%	≥ 50%	≥ 30%
A1. Population reduction observed, estimated, inferred, or suspected in the past where the causes of the reduction are clearly reversible AND understood AND have ceased, based on and specifying any of the following:			
(a) direct observation			
(b) an index of abundance appropriate to the taxon			
(c) a decline in area of occupancy (AOO), extent of occurrence (EOO) and/or habitat quality			
(d) actual or potential levels of exploitation			
(e) effects of introduced taxa, hybridization, pathogens, pollutants, competitors or parasites.			
A2. Population reduction observed, estimated, inferred, or suspected in the past where the causes of reduction may not have ceased OR may not be understood OR may not be reversible, based on (a) to (e) under A1.			
A3. Population reduction projected or suspected to be met in the future (up to a maximum of 100 years) based on (b) to (e) under A1.			
A4. An observed, estimated, inferred, projected or suspected population reduction (up to a maximum of 100 years) where the time period must include both the past and the future, and where the causes of reduction may not have ceased OR may not be understood OR may not be reversible, based on (a) to (e) under A1.			
B. Geographic range in the form of either B1 (extent of occurrence) AND/OR B2 (area of occupancy)			
B1. Extent of occurrence (EOO)	< 100 km ²	< 5,000 km ²	< 20,000 km ²
B2. Area of occupancy (AOO)	< 10 km ²	< 500 km ²	< 2,000 km ²
AND at least 2 of the following:			
(a) Severely fragmented, OR Number of locations	= 1	≤ 5	≤ 10
(b) Continuing decline in any of: (i) extent of occurrence; (ii) area of occupancy; (iii) area, extent and/or quality of habitat; (iv) number of locations or subpopulations; (v) number of mature individuals.			
(c) Extreme fluctuations in any of: (i) extent of occurrence; (ii) area of occupancy; (iii) number of locations or subpopulations; (iv) number of mature individuals.			
C. Small population size and decline			
Number of mature individuals	< 250	< 2,500	< 10,000
AND either C1 or C2:			
C1. An estimated continuing decline of at least: (up to a max. of 100 years in future)	25% in 3 years or 1 generation	20% in 5 years or 2 generations	10% in 10 years or 3 generations
C2. A continuing decline AND (a) and/or (b):			
(a i) Number of mature individuals in each subpopulation:	< 50	< 250	< 1,000
or			
(a ii) % individuals in one subpopulation =	90–100%	95–100%	100%
(b) Extreme fluctuations in the number of mature individuals.			
D. Very small or restricted population			
Either:			
Number of mature individuals	< 50	< 250	D1. < 1,000
VU D2. Restricted area of occupancy or number of locations with a plausible future threat that could drive the taxon to CR or EX in a very short time.	D2. typically: AOO < 20 km ² or number of locations ≤ 5		
E. Quantitative Analysis			
Indicating the probability of extinction in the wild to be:	≥ 50% in 10 years or 3 generations (100 years max.)	≥ 20% in 20 years or 5 generations (100 years max.)	≥ 10% in 100 years
