On Reduction in English: What the English Don't Say

Abstract. The aim of this article is to examine which sounds are most often omitted in official oral public performances by native speakers of British English. Such terms as *reduction*, *elision* (and its types), and *connected speech* are explained; the literature cited is concerned with elision of vowels (triphthong smoothing being treated separately), of consonants, and of whole syllables. The study presents the results of an analysis conducted on selected material available on the Internet – this comprises three British English oral performances of the total length of approximately 20 minutes. With regard to the nature of the data, they were divided into scripted, semi-scripted, and unscripted samples. The research has shown that earlier preparation significantly lowers the number of phonetic reduction phenomena. Furthermore, if the speech is given in front of an audience rather than being pre-recorded, the number of reduction phenomena is higher. Besides, the analysis has shown a few important tendencies in modern British pronunciation, such as omission of /t/, realisation of final /t/ as [?], omission of final /t/ in contractions, which therefore are realised as [n] instead of [nt].

Keywords: reduction, elision, connected speech, British English, oral performace

1. Reduction, elision, and clipping

In order to specify the topic of the article, 1 let us consider two meanings of reduction:

reduce (v.) (1) A term used in the phonological classification of vowel sounds, referring to a vowel which can be analysed as a centralized variant of a vowel in a related form. For

DOI: 10.17951/nh.2017.2.25

The article is based on the author's BA thesis in English Philology at the Pedagogical University of Cracow, written under the supervision of Anita Buczek-Zawiła, Ph.D.

26

Maciej Tomaka

example, the pronunciation of $|\nabla v|$ reduces to $|\partial v|$ when unstressed; the stressed vowels in 'telegraph show reduction in the related word te'legraphy |'telegraft|.

(2) A further phonological use of the term is found in the context of phonological rules, where it refers to a process of simplification which affects certain types of sound sequence. The most important category is consonant cluster reduction (e.g. clock becoming /gpk/), which is common in early child language (Crystal 2008, 406).

In this paper, the focus is on the second meaning, whereby reduction is understood as elision. In phonology, elision, as defined by Crystal (2008, 166), is "the omission of sound or sounds in connected speech".² It may affect vowels, consonants and even whole syllables. Elision may be further divided according to the position of the affected element (Skandera and Burleigh 2005, 96–97):

- aphaeresis: elision of an initial element or elements (*would have* [wəd 'æv]); if the initial omitted element is a vowel, the process can be named *aphesis*;
- syncope: elision of a medial element or elements (answer is ['a:ns.i iz]);
- apocope: elision of a final element or elements (*kept complaining* ['kep kəm'pleinin]).

However, if a part of a word or a whole syllable is omitted, we speak of clipping. Skandera and Burleigh (2005, 97), for instance, distinguish three types of clipping:

- fore-clipping: affects the initial part of a word, e.g. telephone phone;
- back-clipping: affects the final part of a word, e.g. *laboratory lab*;
- fore-and-aft clipping: fore- and back-clipping operate simultaneously, e.g. *influenza flu* or *Elizabeth Liz*.

In fore- and back-clipping, we understand the beginning and the end of a word in terms of its morphological borders.

Since vowel reduction (i.e. reduction in the first meaning) is not the subject of this paper, this change in grammatical words³ is not going to be considered.⁴ However, every non-standard pronunciation of these words will be noted and counted if affected by elision. What will not be counted are contracted forms, which are also treated as reduction, but counting them would be pointless because they are normative.

Connected speech is understood here as a continuous sequence of words typical of natural utterances and conversations. Units (words or phrases) sound different when they are pronounced in connected speech or in isolation. Another important process operating in connected speech, apart from elision, is assimilation (cf. Crystal 2008, 101).

³ That is, strong and weak forms of auxiliary verbs, conjunctions, prepositions, pronouns, articles etc.

⁴ Cf. Reszkiewicz (1981, 139–152) or Cruttenden (2008, 266–268).

On Reduction in English: What the English Don't Say

2. Elision in the literature

Elision, as understood in this article, has been the subject of numerous studies. It is usually divided into elision of vowels, consonants, and whole syllables. Within elision of vowels, triphthong smoothing can also be identified. All these will be described below.

2.1 Elision of vowels

The vowel schwa, transcribed /ə/, is commonly elided after voiceless plosives, namely /p/, /t/ and /k/, in the direct vicinity of a stressed syllable. The loss of the vowel is therefore compensated by aspiration, e.g. potato /pəˈteɪtəʊ/ \rightarrow ['pʰteɪtəʊ], tomato /təˈmɑːtəʊ/ \rightarrow ['tʰmɑːtəʊ] or canal /kəˈnæl/ \rightarrow [kʰnæł]. In such position, schwa is also often dropped when it precedes /n/, /l/ or /r/, which in this case become syllabic, as in police /pəʾliːs/ \rightarrow [pḷˈiːs], tonight /təˈnaɪt/ \rightarrow [tṇˈaɪt] or correct /kəˈɹekt/ \rightarrow [kɪ̞ˈekt]. Notice that in such cases, the boundaries of syllables also change (Skandera and Burleigh 2005, 95–96, Roach 1998, 127).

Cruttenden (2008, 303) points out that /ə/ is often not pronounced at word boundaries when it is initial but preceded by a consonant and followed by a continuant. The continuant in this case becomes syllabic, e.g. *get another* /get əˈnʌðə/ \rightarrow [get ˈnʌðə], *run along* /rʌn əˈlɒŋ/ \rightarrow [rʌn ˈlɒŋ]. Furthermore, it may be dropped before a linking /r/, for example *after a while* /ɑ:ftəɪ əˈwaɪl/ \rightarrow [ɑ:ftɪə ˈwaɪł] or *father and son* /fɑ:ðəɪ əndˈsʌn/ \rightarrow [fɑ:ðɹən ˈsʌn] (ibid).

2.2 Triphthong smoothing

Although triphthong smoothing is also an instance of vowel elision, it has been treated separately, because it affects a discrete category of sounds in English phonetics and phonology, namely triphthongs. These also undergo elision, or to be precise – syncope, which is an omission of the medial element of a triphthong (/ɪ/ or /ʊ/), especially when the following /ə/ is not a separate morpheme. Thus, triphthongs undergo following changes, which are known as smoothing (Cruttenden 2008, 145–146):

- /aɪə/ ⇒ [aːə] in words such as *tyre*, *wire*, *fire*, but also in those where /ə/ is a suffix, such as *buyer*, *higher* or *liar*;
- /auə/ ⇒ [a:ə] in *shower* or *tower*. Note that *tyre* and *tower*, *shire* and *shower* or *buyer* and *bower* become homophones when the smoothing occurs;
- /eɪə/ ⇒ [eːə] as in *player*, *prayer* or *layer*. As we see, the smoothing may take place at morpheme boundaries as well, thus producing homophones, e.g. *prayer* (the words or the act of praying) and *pray-er* (a person who prays) or *layer* and *lair*;
- /əʊə/ ⇒ [3:] as in *mower* or *slower*, which results in homophones with *myrrh* or *slur*, respectively;
- $/319/ \Rightarrow [3:3]$ as in *employer*, *joyous* or *enjoyable*. Note, however, that the first element of the reduced diphthong, namely [3:3], is lower than phonemic /3:1/2.

28

Maciej Tomaka

Moreover, triphthong smoothing occurs not only within one morpheme, but also at a morpheme boundary when word-initial /ə/ comes after a closing diphthong at the end of a word, for instance in *they are* [ðeːə], *go away* [gɜːəˈweɪ], *buy a house* [bɜːəˈhaʊs], *now and then* [naːənˈðen] or *boy and girl* [bɔːənˈgɜːɫ] (Cruttenden 2008, 147).

2.3 Elision of consonants and syllables

The main factor triggering consonant elision is complex consonant clusters. The sounds that are most frequently omitted are plosives and fricatives. Skandera and Burleigh (2005, 95) provide such examples as *clothes* /kləvðz/ \rightarrow [kləvz], *months* /mʌnθs/ \rightarrow [mʌns] or *twelfth* /twelfθ/ \rightarrow [twelθ].

As we read in Roach (1998, 127), the middle plosive is usually dropped in a cluster of two plosives and a fricative or of three plosives, which can be illustrated with such examples as acts / acts

Cruttenden (2008, 303) lists also even more complex clusters: "Thus elision is common in the sequence voiceless continuant + /t/ or voiced continuant + /d/ (...) followed by a word with an initial consonant," which is exemplified by such phrases as *next day* [neks 'der], *raced back* [Jers 'bæk], *last chance* [lɑːs 'tʃɑːns], *left turn* [lef 'tɜːn], *send round* [sen 'Jaond] or *caused losses* [kɔːz 'lɒsɪz]. Further on, we read: "Similarly, word-final clusters of voiceless plosive or affricate + /t/ or voiced plosive or affricate + /d/ (...) may lose the final alveolar stop when the following word has an initial consonant," which is again illustrated with such examples as *kept quiet* [kep 'kwarət], *helped me* ['hełp mi], *stopped speaking* ['stop 'spiːkɪŋ], *changed colour* ['tʃeɪndʒ 'kʌlə], *urged them* ['ɜːdʒ ðəm] or *judged fairly* ['dʒʌdʒ 'feəli] (Cruttenden 2008, 304).

In informal speech, the elision of only two-consonant clusters can be encountered, too, as in *I want to* [aɪ ˈwɒnə], *He went away* [hɪ ˈwen ə ˈweɪ], *Give me* [gɪmɪ] or *Let me* [lemɪ]. Interesting forms are also the informal *gonna*, *gotta*, and *wanna*, which stand for *going to*, *have to* (or *'ve got to*), and *want to* (or *want a*), respectively. The elision also affects the /v/ in *of* in informal speech when it precedes a consonant, e.g. in *lots of them* ['lots ə 'ðem] or *waste of money* ['weist ə 'mʌni] (Roach 1998, 127).

In regional informal speech, /h/ can be elided at the beginning of a word and the word then behaves as if it started with a vowel, namely it takes the *an* indefinite article or [ði] definite article, for instance *an hill* [ən'ɪł] or *the house* [ði'aos]. Even among some RP speakers, one can find such words as *historical*, *hotel*, or *hysterical* realised without the initial /h/ and the grammatical result is the same, as in *an historical novel* [ənɪ'stɒɹɪkṭ 'nɒvṭ]. Such realisation, however, is not common (Cruttenden 2008, 205).

Furthermore, whole unaccented syllables can also be omitted. If the same consonant appears again in the subsequent syllable, the first syllable of the pair is likely to be dropped. This can be observed in numerous words, such as *library* ['laɪbɪɪ] or *particularly* [pə'tɪkjəli] (Skandera and Burleigh 2005, 96).

On Reduction in English: What the English Don't Say

3. Research

In this section, we are going to examine some fragments of genuine official English speech in terms of the reduction phenomena discussed above. The aim of the research is to look into the frequency of the reduction phenomena.

3.1 Selection of the material and procedure

I have decided to analyse approximately 20 minutes of data, consisting of three samples. The first sample, *A short introduction to the Studio School* (henceforth *Studio School*), is a speech by Geoff Mulgan on TED.com from 2011 about new, more practical, and less boring schooling. The second sample is a fragment of a BBC 4 podcast series *In Touch* about the cancellation of the DLA mobility component for disabled people living in residential houses. The last piece of the material, *A History of the World in 100 Objects. Episode 8. Egyptian Painted Pottery Cattle* from BBC Radio 4 (henceforth *Pottery Cattle*), is a fragment of a podcast series about clay statues of cattle in ancient Egypt.

 Sample
 Duration
 Number of speakers

 Studio School
 5' 54"
 1

 In Touch
 10' 13"
 5

 Pottery Cattle
 4' 8"
 1

 Total:
 20' 15"
 7

Table 1. The data analysed

Although *In Touch* is of longer duration and features more speakers than the other two samples, it conforms with the remaining ones, since each speaker talks individually and undisturbed by the others, and only rare interaction between the speakers is observed.

The audio material was downloaded together with transcripts from the source websites. Then the recordings were slowed down and listened to, with the instances of relevant phonetic phenomena being marked on the transcripts.

3.2 Hypotheses

The occurrence of the reduction phenomena is dependent not only on phonetic and phonological features, but also on individual preferences of a speaker, as well as his or her speech tempo or regional origin. Nonetheless, we managed to find samples produced by speakers who use the standard variety of British English. Thus, two hypotheses may be forged.

Firstly, if the samples are not scripted, the number of the reduction phenomena is noticeably higher. Thus, *Studio School* is expected to show a significant number of the phenomena, while *Pottery Cattle* barely any. *In Touch* was labelled as semi-scripted,

30

Maciej Tomaka

since three of the speakers are journalists but the remaining two are not. Therefore, the number of reduction phenomena in *In Touch* should be somewhere between *Studio School* and *Pottery Cattle*.

Secondly, the sounds that are most frequently reduced are stops. Here, apart from /p/, /b/, /t/, /d/, /k/, /g/, affricates /tf/ and /dʒ/ are considered as well, since they also contain a stop element. In order to check this, we kept thorough records of the numbers of reduction phenomena and calculated the percentages.

The results obtained are collated in tables, each dedicated to one sample.

3.3 Studio School

Studio School is a monologue, similar to a very short lecture, delivered in front of an audience. Because of that, it was labelled as unscripted. The reduction phenomena which occurred in the text are listed in Table 2 below.

Time	Fragment	Transcription	Phenomenon
19"	I want to talk	[aɪ 'wɒnə 'tɔːk]	apocope of /t/, aphaeresis of /t/ ⁵
25"	of our conventional	[əv a: kən'venʃənɨ]	syncope (triphthong smoothing)
29"	And it might just be	[ən it 'mai dʒʌs bi]	apocope of /t/ twice
49"	we asked what was	[wi 'a:s wpt wəz]	apocope of /kt/
50"	important need for	[ım'pɔ:tən 'ni:d fə.ɪ]	apocope of /t/
55"	we felt the most	[wi 'feł 'ðə məʊst ɪm'pɔ:ʔn	apocope of /t/ twice
56"	important priority	[itera, rerd	
1'1"	who just didn't like school	[hu dʒʌs dɪdnˌˈlaɪkʔ ˈskuːł]	apocope of /t/, weakening6 of /k/
1'7"	who kept complaining	[hu 'kep kəm'plemmj]	apocope of /t/
1'14"	we try to ask what	[wi 'tıaı tu 'a:s wɒt]	apocope of /k/
1'43"	simple answer in a way	['simpl 'a:nsi in ə 'wei]	syncope of /ə/
2'15"	practical projects	[ˈpɹæktɪkł̩ ˈpɹɒdʒektˀs]	weakening of /t/
2'21"	who would have	[ʔu wəd ˈhæv]	aphaeresis of /h/
2'33"	no extra cost, no selection	[nəʊ ˈekstɹə ˈkɒs nəʊ sɪˈlekʃn]	apocope of /t/
2'47"	learn best by doing	[ˈlɜːn ˈbes baɪ ˈduːɪŋ]	apocope of /t/7
3'07"	famous for its airport	['feiməs fə? its 'eəpɔ:t]	reduction of /r/ to /?/8

Table 2. Reduction in Studio School⁵⁶⁷⁸

⁵ This results in a substandard, informal form, which is sometimes spelt *wanna*. The same form appears in 5'43" in *they want to get*. On the other hand, a few words earlier, the full form ['wont ta] is pronounced in *They want to do things*.

Weakening used in the table stands for no audible release of a stop. However, the records below the table, used for statistics, include both unreleased plosion and reduction to /?/.

⁷ The same occurs in 2'52" in the repeated phrase. However, in 2'50", in the phrase *learn best in teams*, the speaker uses the full form: ['lɜːn 'best ɪn 'tiːmz].

The reduction here appears although the glottal stop most often substitutes the intrusive, not the linking /r/, as in the example above. A bit later, in 3'11" in the phrase *famous for its beaches*, the speaker uses the linking /r/: ['ferməs fəɪ ɪts 'bi:tʃɪz].

On Reduction	in English:	What the	English	Don't Say

3'13"	quite a lot of things	[kwait ə ˈlɒʔ ə ˈθɪŋz]	reduction of /t/ to /?/,9
			apocope of /v/
3'23"	And perhaps most	[ən pʰˈɹ̞æps məʊst]	syncope of /ə/ and /h/10
3'28"	these field trials	[ˈðiːz ˈfiːł ˈtraɪəłz]	apocope of /d/
3'31"	lowest performing groups	[ˈləʊɪs pəˈfɔːmɪŋ ˈgruːps]	apocope of /t/
3'33"	jumped right to the top	[ˈdʒʌmp ˈɹaɪ tðə ˈtɒp]	apocope of /t/ twice, apocope
			of/ə/
3'44"	influenced some people	['ɪnfluəns sm 'piːpł]	apocope of /t/
3'50"	described himself as	[dɪsˈkɹaɪbd ɪmˈself ˈæz]	aphaeresis of /h/
4'5"	helping it work, not just	['hełpɪŋ ɪʔ 'wɜːʔ nɒt dʒʌst]	reduction of /k/ to /?/
5'9"	in fact , my nephew	[ın 'fæ? maı 'nefju:]	reduction of /kt/ to /?/
5'24"	It's not perfect yet	[ɪts nɒʔ ˈpɜːfək ˈjeʔ]	apocope of /t/
6'1"	which is present , not as	[wɪtʃ ɪz ˈpɹeznˌnɒt əz]	apocope of /t/
6'2"	answer for every child	['a:ns fə '?ev.ii 'tʃaɪld]	apocope of /ə/, reduction of
			$/r/$ to $/2/^{11}$
6'4"	at least for an answer	[e? 'li:s fə.ı ən 'a:nsə]	apocope of /t/12
6'10"	make that happen	['mei?'ðæ?'hæpn]	reduction of /k/ to /?/

Some of the examples in Table 2 require a comment. First of all, we have observed the speaker's general tendency to substitute a /t/ preceding a consonant with a /?/. We have found a number of instances in such words as:9101112

- important important priority [Im'po:?n p.iar'p.iəti] (56") and most important of all (3'23");¹³
- importance the importance of [ði ɪmˈpɔːʔns əv] (1'32");
- animate animate them ['ænımeı? ðəm] (5'35");
- that (both strong and weak forms) complaining that the kids [kəmˈpleiniŋ ðə? ðə ˈkidz] (1'7"), ideas that large numbers [aɪˈdɪəz ðə? ˈlɑːdʒ ˈnʌmbəz] (2'45"), that was a nice idea [ˈðæ? wəz ə ˈnaɪs aɪˈdɪə] (2'59"), that influenced some people [ˈðæ? ˈinfluəns sm ˈpiːpṭ] (3'44") and make that happen [ˈmeɪ? ˈðæ? ˈhæpn̩] (6'10");
- not done not through ['dʌ 'nːɒʔ θ.uː] (2'11"), not surprisingly [nɒʔ səˈpɹaɪzɪŋ-li] (3'42"), not perfect [nɒʔ 'pɜːfək] (5'24") and They're not like all [ðeə 'nɒʔ laɪk 'ɔːl] (5'35");
- at at no extra [? new 'ekstre] $(2'33'')^{14}$ and twice in at least [? 'li:s] (6'4" and 6'9");

⁹ What follows, however, is a vowel.

In this case, aspiration of /p/ in an unstressed syllable and appearance of /r/ occur as compensatory phenomena for the elision.

Notice that two seconds later (6'4"), in the phrase *for an answer for some children*, the speaker uses both linking /r/ in *for an* and /ə/ in *answer*, in contrast to the preceding phrase with a similar wording. The form [a:ns] also appears earlier, in 1'43", with linking /r/ following.

¹² At least is again reduced to [9? 'li:s] in 6'9" in the phrase at least can help us.

In 1'38", however, the speaker uses the full form [Im'po:tont].

¹⁴ Interestingly, in 4'58", in the phrase *right at the heart*, we observe no elision: ['.ɪɑɪt ət ðə 'hɑːt].

32

Maciej Tomaka

- but but through real-life [bə? θ.πι: ˌ.πəlˈlaɪf] (2'13");¹⁵
- *it helping it work* ['helpin i? 'w3:?] (4'5");
- *yet not perfect yet*;
- but [np? 'ps:fək 'je? bət] (5'24"), and out you out there [ju 'av? 'ðeə] (5'50").

Furthermore, the speaker tended to drop the final /t/ in negated contractions, as in didn't – didn't like [didn 'laɪk'] (1'1"), didn't have [didn 'hæv] (1'11") or in doesn't – It doesn't animate [It dʌzn 'ænɪmeɪ?] (5'35"). Therefore, these instances will not be counted in the percentage result of reduced words in this sample and have not been included in the table.

With regard to this, the percentage result of reduction is 3.81% (1,050 words in total, 40 reduced¹⁶). The recording gave us 4 examples of syncope, 27 of apocope, 4 of aphaeresis, 9 of weakening. The total number of reduction processes is 44. Stops were reduced in 33 cases (75%) and 26 of them were /t/, vowels in 5 cases and other consonants in 6. The results are presented in Table 3.

			` 1 /	
Words	s in total	Words reduced	d Reduc	tion percentage
1,	050	40		3.81%
	REDU	CTION PRO	OCESSES	
In total	Syncope	Apocope	Aphaeresis	Weakening
44	4	27	4	9
		SOUNDS	AFFECTED	
	Stops in general	/t/	Other consonants	Vowels
	33	26	6	5

Table 3. Reduction in Studio School (unscripted)

3.4 In Touch

In *In Touch*, there are five speakers altogether: two men, who are professional radio journalists, and three women, one of whom is also a professional radio broadcaster; the two remaining speakers are not trained for professional recording – they are people to whom the topic of the programme (the cancellation of the DLA mobility component) applies. They are not guests in the studio so the sample cannot be considered a discussion. Each answer to the journalist's questions is given in an elaborate way (at least a few sentences), which is why this fragment has been chosen for the study. The recording has been classified as semi-scripted. Table 4 presents the reduction phenomena found in the recording.

In the phrase *but independently run*, the speaker does not use the glottal stop: [bət mdɪˈpendəntli ˈrʌn].

¹⁶ By reduced words we understand words in which at least one sound was affected by reduction.

12'24"	to protect the people	[tə prəˈtek ðə ˈpiːpt̩]	apocope of /t/				
12'38"	Eric Westbrook	['e.i.k 'wesb.ii:k]	syncope of /t/				
13'39"	website because essen-	['websait kəz i'senʃəli]	fore-clipping				
/	tially	[rro				

¹⁷ However, in 12'54" in the phrase *I asked him*, there is no apocope but aphaeresis in the weak form: [aɪ ˈɑːskt ɪm].

The same happens in 5'43" and 5'51" (the same speaker), 9'23", 9'42", 9'43", 10'52", 11'17", in the phrase *blind people* in 12'56" and 13'44", *blind games* in 13'53" and *blind person* in 15'22" (different speakers).

¹⁹ The same form appears in 8'23" and 8'34" (each in a different speaker).

The same speaker in the next phrase (7') says but the government has been talking with the syncope and the apocope but this time with the proper stress: ['gʌvəmən]. In 7'52", however, she does not use the syncope. This also occurs in different speakers' speech, as in *The government keep talking* in 10'14" and in the government would want in 10'46".

²¹ The speaker uses the same form in 8'46" and 8'58".

The same occurs in the phrase eventually find one in 14'55".

The same form appears in 11'12", 11'37", and 12'9", but without the weakening.

²⁴ The same form occurs in 11'49" and in 12'51" in the phrase designed for people.

15'31"	would like to try	[wəd 'laı? tə 'tıaı]	reduction of /k/ to /?/		

Moreover, all of the speakers showed a strong tendency to substitute the final /t/ with /2/, not only in pronouns or prepositions, but also in lexical words. Furthermore, they also tended to drop the final /t/ from negative contracted forms. Hence, these instances have been considered as a general inclination and have not been counted as reduction.

Having said this, we may state that 65 words out of 1,775 were reduced, which amounts to 3.66%. There were 68 reduction processes, 47 (69.12%) of which were examples of apocope, 12 (17.64%) of syncope and 3 (4.41%) of aphaeresis, 5 (7.35%) of weakening and 1 (1.47%) of clipping. In total, stops were elided in 61 cases (89.7%), vowels in just 2 cases and other consonants in 6.26 Among stops, /t/ was reduced 25 times. These results are presented in Table 5.

Words reduced Words in total Reduction percentage 1,775 65 3.66% REDUCTION PROCESSES In total Syncope Apocope Aphaeresis Weakening Clipping 68 12 47 SOUNDS AFFECTED Stops in general /t/ Other consonants Vowels 61 25 2

Table 5. Reduction in In Touch (semi-scripted)

3.5 Pottery Cattle

Pottery Cattle comes from one speaker, with the exception of two very short sentences, which are quotes from two professors who contributed to the story, one sentence each. This material was professionally recorded in a studio by a man who, as we assume, had familiarised himself with the text of the speech and prepared for the recording – therefore, it was labelled as scripted. The speaker's pronunciation is much more accurate and clear than in the previous samples. Hence, very few reduction instances have been found. They are presented in Table 6.

²⁵ The word appears twice close to each other: "Ian runs software calles Spoonbill software".

The difference in numbers between reduction processes and sounds affected results from the fact that clipping was counted as one process, but it affected two sounds: /b/, which is a stop, and /i/, which is a vowel.

On Reduction in English: What the English Don't Say

Table 6. Reduction in Pottery Cattle

Time	Fragment	Transcription	Phenomenon
13"	see ourselves entering	[ˈsiː aʊəˈselvz ˈentɪɪŋ]	syncope of /ə/
15"	discovering the hidden	[dɪˈskʌvɹɪŋ ðə ˈhɪdn]	syncope of /ə/
19"	rewriting history	[ɹɪˈɹaɪtɪŋ ˈhɪstɹi]	syncope of /ə/
22"	should be warned that	[ʃəd bɪ ˈwɔːn ðət]	apocope of /d/
36"	almost clerical dryness	['ɔ:lməʊs 'kle.ikl, 'd.ainəs]	apocope of /t/
2'49"	they've been grazing	[ðəv bın ˈgreɪzɪŋ]	reduction of /eɪ/ to /ə/

There are 451 words in this fragment, 6 of which were reduced, that is 1.33%. There were 6 reduction processes altogether, 4 of syncope and 2 of apocope. Stops were elided only in 2 cases (33.33%), whilst the remaining 4 cases concerned vowels (66.66%). Table 7 presents the exact results.

Table 7. Reduction in Pottery Cattle (scripted)

Words in	ı total	Words reduced	Reduction percentage
451		6	1.33%

_		SOUNDS AFFEC	TED
_	Stops in general	/t/	Vowels
_	2	1	4

4. Results

Having demonstrated all the results from our research, we will now refer to the hypotheses we put forward in 2.1.

According to the first hypothesis, the number of reduction phenomena would be smaller in a scripted sample, larger in a semi-scripted one, and the largest in unscripted. That is why we kept thorough statistics of the reduction. The results support our hypothesis, as can be seen in Table 8.

Table 8. Percentage of reduction in the audio material

Sample	Percentage of reduction	Type of speech	
Studio School	3.81%	unscripted	
In Touch	3.66%	semi-scripted	
Pottery Cattle	1.33%	scripted	

The difference between *Studio School* and *In Touch* is, however, minute: 0.15%. Nonetheless, looking at this table, one must bear in mind the other differences between *Studio School* and *In Touch*: they differ in duration (5'54" vs. 10'13"), in the number of words (1,050 vs. 1,775), and in the category of speech they represent (a monologue

36

Maciej Tomaka

in front of an audience and a prepared radio programme with journalists and guest speakers).

It seems that our findings favour the second hypothesis as well. In the material, there were 119 elements reduced altogether, 96 of which were stops, which gives the result of 80.67%. The remaining elements were: vowels -11 (9.24%), fricatives -8 (6.72%), and other consonants -4 (3.36%).

The frequency of occurrence of reduction in the whole material is 3.39% (that is, 111 words reduced out of the total of 3,276). Table 9 presents the detailed data.

Words	in total	Words reduced		Dargantaga		
Words	Words in total		words reduced		Percentage	
3,2	3,276		111		9%	
	REDUCTION PROCESSES

	general				consonants	
119	96	52	11	8	4	
	80.67%	43.7%	9.24%	6.72%	3.36%	

Table 9. The whole empirical material

5. Conclusion

The research shows that prior preparation and speaking with the aid of a script influence the occurrence of elision. The audio material has provided us with a straightforward answer, although one must bear in mind the differences between the samples analysed.

Furthermore, stops proved to be the most frequently elided elements in the audio material: they constituted more than 80% of the elements reduced. Amongst all the stops elided, the most significant number falls on /t/, which constituted 54% of them. This means that /t/ alone constituted more than 40% of all the elements affected by reduction. Furthermore, final /t/ was reduced in 43 cases, which is more than a third of all the sounds reduced. The second most frequently elided elements were vowels, but they amounted to less than a tenth of the total.

Another conclusion which may be drawn from the analysis of the audio material is that in present-day colloquial English, there is a strong tendency to use [?] in the place of final /t/ before a vowel. Another easily observed tendency is an omission of the final /t/ of the negative contracted forms, so that -n t, normally pronounced as [nt], is realised as [n].

This study has shown that phonetic reduction is a topic worth studying, since it affects native speakers' pronunciation to a noticeable extent. The analysis has confirmed that earlier preparation for speaking influences the pronunciation, namely there

are fewer reduction phenomena. The present paper can be beneficial in teaching not only of pronunciation but also of listening skills. It may help teachers provide explanations and choose proper materials for classwork (semi- or unscripted samples, rather than recorded in a studio). This may also be an inspiration for new research, such as looking into students' listening comprehension of various speeches: official, informal, colloquial, or scripted, semi-scripted, unscripted. The type of communicative situation seems to be worth considering, too, e.g. a public and official speech (for instance, given by a politician), a presentation in front of an audience, a presentation recorded in order to be listened to and without an audience present, a recorded podcast, a video, TV or radio news, TV or radio programmes (interviews, reports, phone calls from listeners or viewers).
